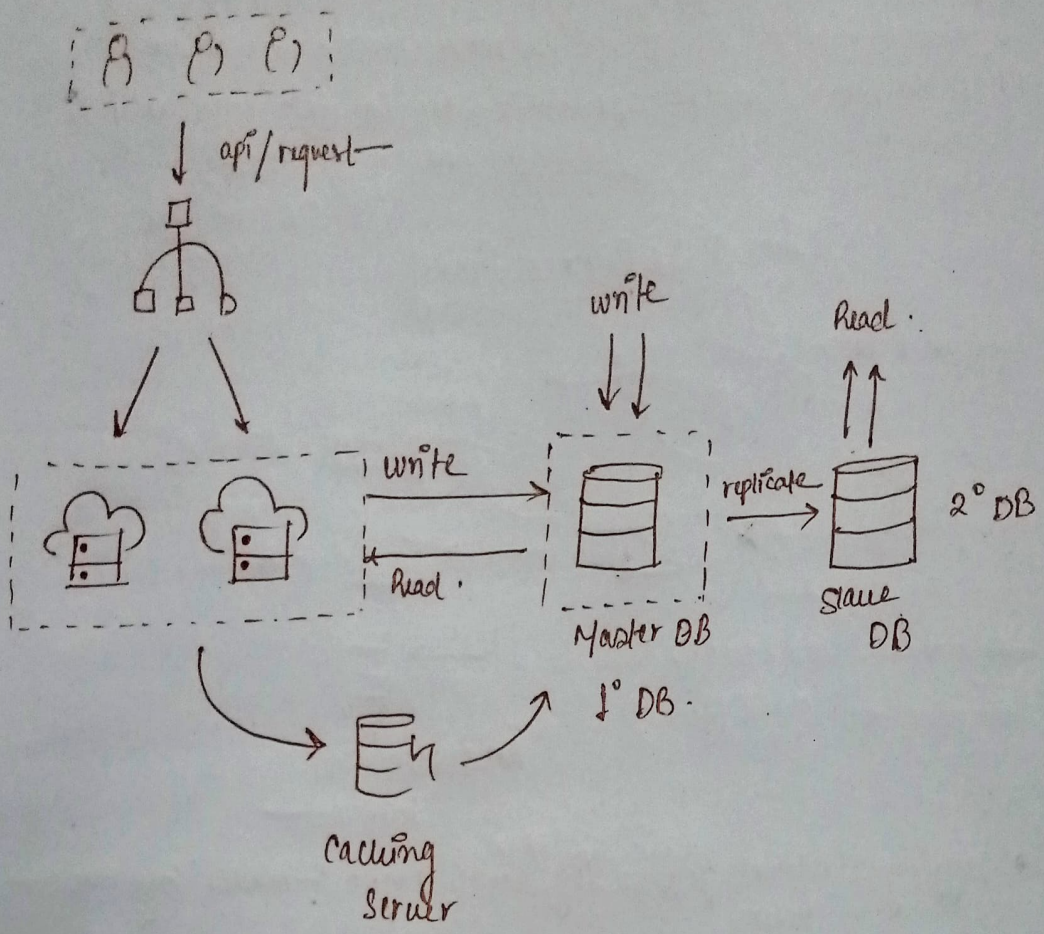
Creating Diagram -(6)

Distribute Traffic using a Load Balancer.



Indexing in Database -(7)

- Adding Indexes to sheets = fast search of books.

Type of Indexing method

1) Primary : main value for uniqueness and fast access.

2) Secondary : Use another column with the primary key.

3) Composite : Indexing based on multiple columns to identify results.

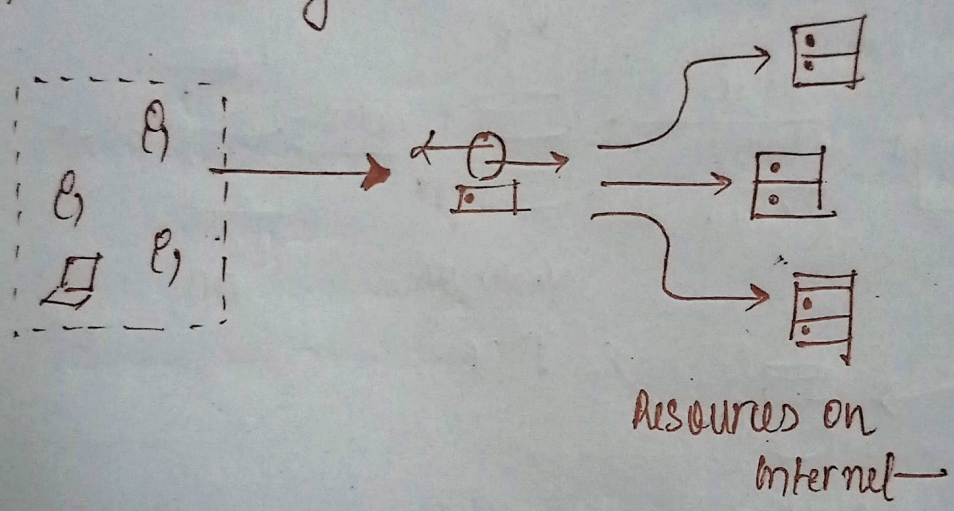
4) Hashing : Using a function to store the data in ~~auto~~ calculated buckets.

Challenges

1) The number of write operation will increase.
2) Adding indexes is not free, we need more space
↳ more cost incurred.
3) Clean up unused indexes periodically. (audit regularly).

Forward & Reverse Proxy

1) Forward Proxy



- Logging : allows you to log each request made by the user.
- Traffic control : You can govern what traffic to pass and which to block.
- Encryption : Make sure that all the traffic going through the proxy server is encrypted.
- Client Anonymity : servers do not know who the clients are
